Introduction	7
Chapter 1 Foundations of the Quantum Theory of Condensed Matter	13
1.1 Key concepts from the quantum mechanics of a system of a large number of particles	13
1.1.1 Fundamental principles of quantum mechanics used in the description of individual electrons	13
1.1.2 Quantization of energy in a potential well	15
1.1.3 Coupled quantum wells and the splitting of levels	18
1.1.4 An electron in a periodic potential. Bloch's theorem	24
1.1.5 Formation of energy bands	28
1.2 The ideal electron gas: ground state and excitations	34
1.2.1 The Born–Oppenheimer approximation	34
1.2.2 The Pauli principle and the filling of quantum states	34
1.2.3 The Fermi sphere and the ground state of the electron gas	35
1.2.4 From the atomic electron collective to the electron collective in a crystal .	37
1.2.5 Excitations for the ideal electron gas	38
1.3 Phonons, quantization of the harmonic oscillator	42
1.3.1 Coherent and squeezed states	42
1.3.2 Second quantization of bosonic systems	49
1.3.3 Vibrations of a one-dimensional crystal lattice	50
1.3.4 The quantum LC resonator	54
Chapter 2 Microscopic theory of the non-ideal electron gas	59
2.1 Electron–phonon interaction	59
2.1.1 Transition to the effective electron–electron interaction	60
2.1.2 Diagrammatic representation and matrix elements of the electron–phonon interaction	62
2.1.3 Condition for the emergence of a bound state of two electrons (the Cooper problem)	65

2.2 Determination of the ground state of a Fermi gas with attraction between the particles	69
2.2.1 The Bardeen–Cooper–Schrieffer Hamiltonian	69
2.2.2 The wave function of the ground state	70
2.2.3 The occupation amplitudes of the states u_k and v_k	72
2.2.4 The self-consistency equations in the Bardeen–Cooper–Schrieffer theory .	74
2.2.5 The condensation energy and the spectrum of single-electron excitations .	76
2.3 Excitations of the non-ideal electron gas: the Bogoliubov transformation	79
2.3.1 Diagonalization of the Hamiltonian, Bogoliubov quasiparticles	80
2.3.2 The spectrum of excitations in the non-ideal electron gas	85
2.3.3 The energy gap and its relation to the critical temperature	86
Chapter 3 Spatially Inhomogeneous Problems for Electron Collectives	97
3.1 Transition from the Momentum to the Coordinate Representation	97
3.1.1 Cooper Pairing in the Coordinate Representation	98
3.1.2 Effective Hamiltonian of the Inhomogeneous Electron Gas	100
3.2 Bogoliubov–de Gennes Equations	101
3.2.1 Bogoliubov Transformations in the Coordinate Representation	101
3.2.2 Symmetries and Properties of the Excitation Spectrum in the Nonideal and Inhomogeneous Electron Gas	103
3.2.3 Density Matrix	104
3.2.4 Self-Consistent Expressions for the Fields $\Delta(\vec{r})$ and $B(\vec{r})$	106
3.2.5 Spatially Homogeneous Case and a Superconductor Carrying a Current . .	109
3.2.6 Derivation of the Ginzburg–Landau Functional from the Microscopic Theory	110
3.3 Green’s Function Formalism	115
3.3.1 Causal Green’s Function	116
3.3.2 Spectral Density and Analytic Properties of the Green’s Function	118
3.3.3 Matsubara Representation, Temperature Green’s Function	120
3.3.4 Gor’kov Equations	123
3.3.5 Quasiclassical Approximation. Eilenberger and Usadel Equations	126
Chapter 4 Charge transport in heterostructures	133
4.1 Basic concepts. Simplest examples	133
4.1.1 Conductivity of a metal in the Drude model	133

4.1.2 The band nature of the spectrum for metals and insulators	135
4.1.3 Quasiparticle tunneling in heterostructures	136
4.1.4 Andreev reflection and the conductivity of a normal-metal–superconductor (NS) contact	141
4.2 The proximity effect in heterostructures	144
4.2.1 Diffusive description of materials	144
4.2.2 Conditions at the interface of two materials	146
4.2.3 Contact of two semi-infinite N- and S-metals	153
4.2.4 Spatial behavior of superconducting correlations in SF- and SN-structures	156
4.2.5 Microscopic estimate of the interface resistance	162
4.2.6 Taking into account the finite film thickness and the properties of the boundary	163
4.2.7 Numerical modeling of the proximity effect in realistic structures	165
4.2.8 Superconductor–normal-metal–superconductor (SNS) heterostructure . . .	167
4.3 Microscopic description of the Josephson effect	171
4.3.1 Tunnel (SIS) junction	172
4.3.2 Contact through a normal-metal layer (SNS)	177
Chapter 5 Examples of macroscopic quantum devices in electronics	185
5.1 Macroscopic description of Josephson structures	185
5.1.1 Key parameters in dynamic processes	188
5.1.2 Josephson generation	192
5.1.3 Resistive model of a Josephson junction	195
5.1.4 Josephson junction in an external magnetic field	199
5.2 Basic elements of superconducting logic circuits	214
5.2.1 Two-junction interferometer (dc SQUID) as part of a logic element	216
5.2.2 Adiabatic parametric quantron (AQFP)	219
5.2.3 Quantum operating regime of superconducting circuits	229
5.3 Quantum algorithms	235
5.3.1 Variational Quantum Eigensolver (VQE)	236
5.3.2 Quantum Approximate Optimization Algorithm (QAOA)	242
